

FUSION OF COMPUTERIZED MEDICAL DATA

Abstract of Disclosure

A method and system of diagnosing cardiac syndromes. The method includes acquiring data from a first and second diagnostic test, and then processing the data from the first and second diagnostic test to produce a first and a second indicator. Next the indicators are combined and a risk of a cardiac syndrome based on the combination of the indicators is calculated. The system includes a first and a second physiological activity acquisition module and a fusion engine to receive the data acquired by the modules and to generate a risk of ACS based on a combination of the data.
